EasiShare and IBM COS for Secure and Tracked File Sync, Share and Collaboration

Requirements

An award-winning leading educational institute in Singapore was looking to enable more than 3,000 users with easy and secure access to their stored files across multiple campuses.

However, the school had disabled SMB protocols and restricted the use of USB ports due to security needs.

They needed a secure, smooth, and collaborative platform to manage their workflows.

EasiShare + IBM COS

EasiShare acts as a gateway between the IBM COS storage, users and applications. It enables secure and tracked file sync, share, and collaboration.

The EasiShare-IBM COS bundle (HTTPS + S3) is markedly more secure than SMB protocols. The bundle also provides better scalability and always-available access to data.

Centralised point of data management (file and content management systems) with centralised tracking, monitoring, and early breach detection.

⑤ easishare

Trusted by Governments and Enterprises.

Secure platform for collaboration that tracks and monitors.
